Habit and continuance intention in social commerce platforms

Abstract

Drawing on habit theory, this paper investigates continuance intention among social commerce users in Indonesia. Survey data from 412 users show that habit significantly increases continuance intention, whereas satisfaction influences continuance mainly through habit.

Results

Repeated satisfying purchase experiences were positively associated with habit formation (beta = 0.52). Habit had a strong positive effect on continuance intention (beta = 0.47, p < 0.001).
