Online content quality, customer engagement and repurchase intention in food social commerce

Abstract

This study examines how online content quality (OCQ) shapes repurchase intention in food social commerce. PLS-SEM analysis highlights the significance of OCQ in enhancing customer trust and engagement while underscoring the importance of emotional gratification and perceived social benefits mediating customer engagement in building repurchase intentions. The analysis also reveals the insignificant direct effect between social value and repurchase intention, suggesting a more nuanced mechanism in consumer behavioural response.

1. Introduction

Food businesses increasingly sell through social media platforms. Previous studies highlight OCQ as a driver of consumer trust, purchase decisions, and behavioural intentions, specifically in food business content, but often limit its role to informational accuracy and credibility [44-46]. This study extends that view.

4. Results

Content quality had a positive and significant effect on trust (beta = 0.41, $p < 0.001$) and on customer engagement (beta = 0.38, $p < 0.001$). Engagement significantly predicted repurchase intention (beta = 0.29, $p < 0.01$). Social value did not have a significant direct effect on repurchase intention (beta = 0.05, $p = 0.41$).

5. Discussion

The findings indicate that engagement acts as a key pathway through which content quality translates into repurchase intention among Indonesian food social commerce consumers. Because the data are cross-sectional, causal claims should be made with caution.
